

# Poultry Feeds and Feeding

## Food or Feed

It is eaten by man or animal, digested, absorbed, metabolized and utilized by the body cell.

## COMPONENTS OF FOOD

1. Water
2. Dry matter
  - a. organic
    - i) carbohydrate
    - ii) protein
    - iii) fat
    - iv) vitamins
  - b. inorganic
    - i) minerals

## ESSENTIAL FEED NUTRIENTS

Carbohydrate, protein, fat, minerals, vitamins and water etc which are essential for growth, maintenance, production and reproduction of a man or animal.

- ▶ No energy is produced from water, vitamin and mineral
- ▶ CHO, protein and fat are called energy giving nutrient.

## FUNCTIONS OF ESSENTIAL FEED NUTRIENTS:

### Water:

- *Sources:* Water present in feed, Metabolic water and drinking water
- *Requirement of water:* Poultry (adult)-0.20 liter/day
- *Function:*
  1. Cell rigidity and elasticity
  2. Solvent action
  3. Lubrication
  4. Hydrolytic reactions
  5. Ionic reaction
  6. Transportation
  7. Heat regulation
  8. Respiration function
  - 9.

### Carbohydrate:

1. Energy supply
2. Glycogen stored in liver and use in starvation
3. Maintain body temperature
4. Lactose helps to develop brain cell (lactose found in milk & it is known as milk sugar)  
(firstly CHO is used for energy supply in the body, if any kind of CHO deficiency occurs in the body then fat is used for energy supply, when CHO and fat both are deficit in the body then energy is produced from the protein)

## **Protein**

1. Build up body tissue
2. Repair of body tissue
3. Synthesis hormone and enzyme
4. Feathers, nail, hair and wool formation
5. Energy supply (CHO and fat deficiency )  
(animal protein is high quality than plant protein, because animal protein contains all essential amino acids and it is also efficiently utilized)

## **Fats**

1. Energy supply (It gives 2.25 times more energy than CHO and protein)
2. Skin smooth and oily
3. Flavor and palatability
4. It carries fat soluble vitamin (A,D,E,K)
5. Reserved under the skin and utilizes during starvation  
(excess CHO and protein converted into body fat)

## **Minerals**

1. Bone and teeth formation
2. Blood cells contain a small amount of minerals for the normal function of blood cells.
3. Maintenance of ionic equilibrium and osmotic pressure.
4. Maintenance of acid-base equilibrium.
5. Minerals are directly related to the structure and functions of membranes.
6. Minerals are also found as structural components of some hormones
7. It activates the enzymes.

## **Vitamins**

### ► Fat soluble vitamins:

Vit-A: Prevent xerophthalmia or night blindness. It helps eye vision.

Vit-D: It helps to absorption of Ca from the intestine for bone and teeth formation.

Vit-E: It helps in reproduction.

Vit-K: It helps to clot blood.

### ► Water soluble vitamins:

Vit-B Complex: Prevent anemia, helps growth and metabolism.

Vit-C: It is essential for the collagen formation (found in the gums) and prevents scurvy.

## **Caloric content of fat, protein, carbohydrates and alcohol**

Calories are needed to provide energy so the body functions properly. The number of calories in a food depends on the amount of energy the food provides. The number of calories a person needs depends on age, height, weight, gender, and activity level. People who consume more calories than they burn off in normal daily activity or during exercise are more likely to be overweight.

Fat: 1 gram = 9 calories

Protein: 1 gram = 4 calories

Carbohydrates: 1 gram = 4 calories

Alcohol: 1 gram = 7 calories

<i>1g nutrient</i>	<i>Energy (Calories)</i>
CHO	4
Protein	4
Fat	9

# Classification of poultry Feeds

## 1. Roughage feed

Roughage are bulky feeds containing large amount of crude fibre (CF) more than 18% and low (about 60%) in T.D.N. on air dry basis. eg, straw, grass, fodder etc.

Poultry birds are non ruminant, so they can not digest fiber as like as animal. But they can digest small amount of vegetables, such as cabbage, Ipip-Ipil or any succulent leafy vegetables or grass.

## 2. Concentrate Feeds

Concentrates are feeds which contain small amount of CF (less than 18%) and high (more than 60%) in T.D.N. on air dry basis. eg. grain, oil cake, fish meal etc.

### A. *Animal origin* -

Fishmeal, Blood meal, Meat Offal, Meat Meal, Feather meal, Hatchery by product meal, Surplus milk etc.

### B. *Plant origin* -

Products: Maize, Wheat, Barley, Oats, Sorghum, Bajra, Khesari, Maticali, Sweet potato etc.

By - products: Rice bran, Wheat Bran, Corn flower, Wheat flower, Bran of Khesari and Maticali, Molasses, oil cake etc.

**3. Mineral supplements:** Oyster shell, Bone meal, Egg shell, Lime stone, Chalk powder, Common salt, Vitamin-mineral premix etc.

**4. Vitamin supplements:** All leafy vegetables, Yellow corn, Fish liver oil, Vitamin-mineral premix etc.

## 5. Feed Additives

They are not nutrients. These are included in the ration to increase the intake of feed, digestion, absorption and metabolism. Sometimes it is used to improve the quality of the products and to keep health sound against diseases. They are also called non-nutrient feed additives.

### Examples:

Antioxidants, Flavouring agents, Pellet binders, Xanthophylls, Canthaxanthin, Grit, Enzymes, Pribiotics, Antibiotics, Hormone, Antifungal and Anticoccidial drugs etc.

## Feed ingredients with source of nutrients

Nutrients	Sources
<b>Carbohydrate</b>	Maize, wheat, oat, barley, broken rice, rice polish, wheat middling, wheat bran etc.
<b>Protein</b>	Animal source -Fish meal, blood meal, meat scraps, meat offal, frog meal, feather meal, meat meal, milk products etc. Plant source-Til oil cake, mustard oil cake, ground nut oil cake, soybean meal, Khesari, cottonseed meal, peanut meal, sunflower seed meal, sesame meal
<b>Fat</b>	Oil seeds and vegetable oils.
<b>Mineral</b>	Common salt (NaCl), oyster shell, steamed bone meal, egg shell, limestone, dicalcium phosphate, rock phosphate, manganese sulfate, manganese oxide, zinc carbonate, zinc oxide, vitamin-mineral premix, etc.
<b>Vitamins</b>	Vitamin-mineral premix, alfalfa meal, leafy vegetables, and milk by-products.
<b>Water</b>	Fresh clean drinking water.

## Methods of Poultry Feeding

Improperly fed well-balanced ration will not give the most satisfactory results unless a satisfactory method is followed. Some of the methods are as follows:

### 1. Whole grain feeding system:

In this system feed ingredients are supplied to the birds in the separate containers.

### 2. Grain and mash method:

In this system some ingredients are supplied as grain or grain mixture along with balanced mash.

### 3. All mash:

This is a scientific and popular method. Ingredients mixture mash is fed either in dry or wet.

### 4. Pellet feedings:

Now-a-days it is a very popular method. There is no option for bird during feed intake. Pellet is prepared from dry mash under high pressure. In this system wastage of feed can be avoided.

### 5. Crumble feeding:

It is grinding form of pellet, granular in shape. Suitable for early feeding of broiler and chicks. Sometimes shows better performance than pellet.

## **Poultry Ration**

### **Ration**

Amount of feed which an animal intakes within 24 hours. The feed may be given at a time or in portions at intervals. It may or may not be balanced.

### **Balance Ration**

A ration which contains all recommended essential feed nutrients according to age and purpose and condition. of an animal. There are 2 types of balance ration-

- a. Maintenance ration
- b. Production ration

**Maintenance Ration**-The balance ration which is required for an animal to maintain its normal physiological functions of the body. There is no loss or gain body weight and even no chemical change of body composition.

**Production Ration**- The balance ration which is required over and above maintenance ration. This is an additional allowance of ration with maintenance ration.

### **Ration for layer and duck**

1. Starter
2. Grower and
3. Layer ration

### **Ration for Broiler**

1. Starter
2. Grower and
3. Finisher ration

### **Requisites of a Good Quality Poultry Ration**

1. Balanced with essential feed nutrients according to age and purpose.
2. Variety of ingredients.
3. Fresh ingredients.
4. Feed ingredients should be crushed.
5. Calori-Protein ratio should be present
6. Palatable for birds.
7. No bad flavour.
8. Low moisture.
9. Addition of vitamin-mineral premix.
10. Free from fungus and larve of parasites.
11. Addition of micro-nutrients and feed additives.
12. The ration should be highly digestible
13. Provision of fresh clean drinking water.
14. Ration should be economic
